Q:

I bought a used cytomat 6001 from a company which was closing down. It came with test software disk from Liconic, but the command codes are not listed. I wanted to test the positioning of the swap station by having the shovel go in and out.
Can you send me instructions on using the test software?

A:

```
RD DM22;             reads transfer height
WR DM123 63450;   puts it in the service mode
WR DM6 [value of DM22]
ST 1702;             turns out
ST 1701;             shovel out
RS 1701;             shovel in
RS 1702;             turn back in
WR DM123 0;          exit service mode
```
