Q:

I was reviewing the log files and noticed that the file from February has an erratic humidity reading while the latest log is stable at 87-88%. Do you think that this is having the affect on the temperature control because we are heating to increase humidity?

A:

Unfortunately we did not have the set points for this unit at the time of order. We are in the process to do this optimization step. Please note that it is very helpful to have to actual operating conditions available in the order so we can run tests with the actual settings.
